

A company with the spirit of invention

Nickel Putter

Some things are good just as they are. However, there are some people who are always striving to make things even better. These are people who have vision and who know how to make a good product perfect.

Werner Nickel, the founder of NICKEL PUTTER, is one of these visionaries. As a certified mechanical engineer, he has spent almost his entire life rethinking products and putting his ideas into practice. A keen golfer, he has been dreaming secretly of creating the perfect putter for a long time...

After 3 years of intensive development, Werner Nickel finally held it in his hands: The precision high-tech putter with the patented advantage. In addition to its superb putting behavior, it enables golfers to mark their ball without bending over a real world first.

Two advantages make it unbeatable: 1) High-tech construction: first class putting behavior due to precision engineering. 2) Patented technology: mark the ball easily while standing.

The High-tech Putter

High-quality CNC engineering provides perfect balance. Additional weighting added to each end of the stroke surface allows for exceptional swing stability and greater ball control during the follow-through.

The specially lengthened, continuous aim line, which traverses the entire putter at ball level, lends the NICKEL PUTTER No 1 a feeling of security in the address position.

The Patented Advantage

Mark the ball while standing. (pictured above). The patented and user-friendly mechanism allows you to mark and pick up the ball, or reposition it precisely and remove the marker in one motion. Again, without bending over.

Also, the sunken ball can be retrieved from the hole without bending over, by using the Ball Pick-Up attached to the end of the putter grip. The Ball Pick-Up is also sold separately and attaches to any club.

USGA Stamp Of Approval

Create a competition putter in one simple step: The USGA stamp of approval is for the so-called No 1 Competition, excluding the balancer. The balancer can be easily removed with one simple movement of the hand. Important: The total weight of the NICKEL PUTTER No 1 is almost unaffected by the removal of the balancer. Its putting effectiveness remains unchanged.

Nickel Putter Ball Pick-Up

The Nickel Putter Ball Pick-Up attaches easily to any club within minutes. Opening for use requires a single thumb motion, and closing is just as easy. When not in use, the Ball Pick-up looks and feels like a natural extension of the club's shaft. Get rid of those annoying suction cups and move up to a far superior German engineered technology.

Putter head

Weight: 350g - Stroke surface angle: 3° - Lie: 70°

Material:

Hard, surface-coated aluminium

Additional Side Weights:

The weights are embedded right and left, directly behind the insert, shifting the center of gravity forwards. This ensures a high level of swing stability and good ball control in the follow-through, having an overall positive effect on the putting behavior.

Insert:

The insert is made from a special alloy and guarantees exceptional ball contact.

Marker:

The marker is made of magnetized stainless steel and is held in position by a magnet integrated into the putter head.

Important Note:

Do not bring magnets into close contact with objects, which react sensitively to magnetism. Keep magnets away from pacemakers
